- User Acceptance Test Plans:

1. Login test:

In this test, we will check the application's login functionality by providing login information of both existent and non-existent users and ensuring that they return with the correct status messages.

2. Register test:

In this test, we are going to test the register functionality of the application. This test will simulate a user registering for the application using different emails and usernames and then check for their existence in the database.

3. Upload test:

In this test case, we will upload pics with tags/categories by different test users and check for their existence in the system post-upload.

- Automatic Test Cases: Travis CI

For our automatic test cases, we will be using Travis CI and PHPUnit. Please find the results of our test cases at <https://travis-ci.org/meadej/finks>. The test cases themselves can be found in *RegisterTest.php*, *UploadTest.php*, and *LoginTest.php*. Several of the test cases are currently in a failing state because we are still working on integrating the functionality of our backend with the interface of our front end.
